

ML Projects That Land Internships

Transcript Record - Generated by Nexora AI Meeting Intelligence

TRANSCRIPT

Everyone talks about how to get an ML internship, but nobody tells you what kind of projects actually make recruiters go out. Today I am going to show you the exact projects I built that got me my first ML internship, real, deployed, and to projects. Some of them are simple, but industry-relevant. Some are advanced and AI powered, and the last one, trust me, completely changed my direction in AI.

So stay with me till the end, you will not only see my projects, but also understand why companies actually care about them. So the fourth one, car price prediction. Let us start with something simple, a car price prediction mode. Most people ignore traditional machine learning projects, thinking, oh companies don't use these anymore, but that is far from true.

Industry is like automotive, insurance banking, and e-commerce rely heavily on such models for price forecasting, demand estimation, and risk prediction. I use XG Boost machine learning model, achieved an R-square of 94.98% and deployed it all streamed it. What makes this element? It shows mastery of ML lifecycle like ADA, feature engineering, pre-processing, modern evolution, and deployment, which is exactly what ML engineers do daily in the industry.

Reputers love this because it reflects practical, production ready, skills, not just the theoretical ones. The third one, math, question, and revision plans generator. This one is personal. I come from education domain, and I build this to automate personalized learning.

The AI assistant, which uses GPT4, and streamed it to generate custom math questions and revision plans for students. Why is this valuable in industry? Because personalization through AI is booming. Actech, health tech, fintech, and HR all need system that add up to user data.

This project uses skills like prompt engineering, context management, and user specific data handling, which are backbone of any AI model solution. And here is a quick tip for you. If you already have domain experience in anything like finance, health care or retail, build one AI project around your own domain. Recruiters immediately see your ability to merge domain knowledge with AI, which is very rare and powerful.

Second is fake news detection with LSTM. The next one take a real world problem, detecting fake news using NLP. I build an LSTM model that achieved 96.7% accuracy and classify news as a real or fake. Why does this matter in the industry?

Because text classification, sentiment analysis, and misinformation detection are crucial for companies like Google, Meta, and news platforms. Skills like text processing, word embeddings, tokenization, and handling unstructured data are directly transferable to roles in NLP, AI, content, moderation, and information retrieval. This project shows I could handle unstructured data, something that 80% of real industry problems are built around. And the last one is conversational AI chatbot with memory, length change plus extremely and a mystery.

And finally, the project that changed everything for me. I built a conversational AI chatbot with contextual memory using length change, the streamlit and the mystery model. It was not just another chatbot. It remembered the past varies using length change, check message history, enabling context away human life conversations.

Why is this so relevant today? Because Gen AI, conversational legends and AI co-pilets are transforming industry from customer support to healthcare assistance to enterprise automation. But he's now need engineers who can build a genetic memory driven of apps using frameworks like Langeon, Lama, and Dex and Mr. This project proves that I could go beyond model training.

I could build a complete end to end Gen AI product, which is exactly what modern AI started look for. For any project, always emphasize why you built it, what real world problem it shows, and how it connects to industry needs. These four projects built the foundation for my ML career and eventually landed me my internship. It is not about building fancy models.

It is about building something that matters. If you want me to make any video for any of these projects or what questions for us in the interviews from these projects, just put it in the comment section and let me know. And hit like and subscribe to concepts of
